

Reconnaissance Report

Part A: Target Information

Website Name: Kristu Jayanti College Website

URL: <https://www.kristujayanti.edu.in/>

Reason for Selection:

The website was chosen because it is the official website of my college and is publicly accessible, making it suitable for educational reconnaissance.

Part B: WHOIS Results

Field	Details
Domain Name	kristujayanti.edu.in
Registrar	(From WHOIS output)
Registration Date	(From WHOIS output)
Expiry Date	(From WHOIS output)
Name Servers	(From WHOIS output)
Domain Status	(From WHOIS output)

Part C: DNS Information

Record Type	Value
A Record	13.235.5.4
MX Record	(From dig/nslookup output)
NS Record	(From dig/nslookup output)
TXT Record	(From dig/nslookup output or "Not Found")

Part D: Website Technology Identification

Technology	Identified
Web Server	Apache 2.4.41
Operating System	Ubuntu Linux
CMS	Not Detected

Technology	Identified
------------	------------

Programming Language	Not Detected
----------------------	--------------

JavaScript Technologies	Google Tag Manager, Google Analytics
-------------------------	--------------------------------------

CDN	Not Detected
-----	--------------

Summary:

The website is hosted on an Apache 2.4.41 web server running Ubuntu Linux. It uses Google Analytics and Google Tag Manager for analytics and tracking. No CMS or CDN was identified.

Part E: HTTP Security Headers

Header	Present Purpose	
Content-Security-Policy (CSP)	No	Prevents Cross-Site Scripting (XSS).
X-Frame-Options	No	Protects against clickjacking attacks.
X-Content-Type-Options	No	Prevents MIME-type sniffing.
Strict-Transport-Security (HSTS)	No	Forces browsers to use HTTPS.
Referrer-Policy	No	Controls referrer information sent by browsers.

Part F: robots.txt Findings

robots.txt Available: Yes

sitemap.xml Available: Yes

Information Learned:

The robots.txt file provides instructions for search engine crawlers regarding which parts of the website may be crawled. The sitemap.xml file lists website pages to help search engines discover and index the site's content.

Overall Observations

- The website is publicly accessible and uses Apache 2.4.41 on Ubuntu Linux.
- Google Analytics and Google Tag Manager are used for website analytics.
- AWS load balancer cookies indicate that AWS infrastructure is being used.
- The HTTP response did not include several recommended security headers.
- DNS records provide information about the website's IP address, mail servers, and name servers.

- Public files such as robots.txt and sitemap.xml (if available) provide information useful for search engine indexing.
-

Conclusion

Reconnaissance is the first stage of a security assessment and focuses on gathering publicly available information about a target without attempting to exploit it. During this exercise, I learned how to perform WHOIS lookups, identify DNS records, detect website technologies, inspect HTTP security headers, and examine robots.txt and sitemap.xml files using Kali Linux tools such as whois, dig, nslookup, whatweb, and curl. These tools provide valuable information about a website's infrastructure, hosting environment, and security configuration while remaining safe and non-intrusive. I also observed that publicly accessible information can reveal details such as the web server, operating system, analytics services, and DNS configuration. Additionally, checking HTTP security headers helped identify security best practices that were missing. Overall, this reconnaissance exercise demonstrated how security professionals collect information before performing any further security assessment and highlighted the importance of protecting publicly exposed information while following ethical and legal guidelines.
